

Project Topic: Predicting heart disease based on health data/metrics

Goals: Predict successfully if a patient has heart disease or not based on given health feature data

Timeline:

Data clean up and data exploration (**By 10/11**)

Feature extraction: making sure that the data can easily be utilized by machine learning models (**By 10/18**)

Visualize the data to explore how the data looks and what visualizations could be used in the project to convey meaningful findings (**By 11/1**)

Determine what models would be meaningful for the data and predict the target successfully (**11/22**)

Train the models and test the models' performance (**By 12/2**)

Final wrap up and ready project for final submission (**By 12/9**)

Data Collection/Gathering:

Data is being used from UC Irvine Machine Learning Repository:
